The submersible pump designed for abrasive applications
Audex ® submersible pumps have been developed for use in the toughest and most abrasive applications and environments. Specifically, they are in use by many of the world's largest aggregates and recycling companies, in the heaviest of industrial applications.

Audex submersible pumps are used in many industries including:

- Mining
- Quarrying
- Recycling
- Cement plants
- Industrial dewatering
- Ready-mix concrete plants

With many unique design features they are the submersible pump of choice for many operators in these fields. Their ability to withstand wear from abrasive, highly corrosive fluids is legendary.

**Continuous Improvement & Product Development**

- Continuing to work with clients to develop ever improved products and solutions is key to our future development.

- Our engineers, based in Sheffield, UK, are working on innovative designs to reduce costs and maintenance downtime.

- The close proximity of the Advanced Manufacturing Park, home to companies such as Boeing and Rolls Royce, gives a ready availability of access to leading technologies, all in compliance with the strictest environmental and safety standards.
Dewatering

Water can contain many different suspended solids, requiring different pump technology and different methods. That’s why choosing a total solution for dewatering is key to ensuring successful, cost effective operations.

Audex while predominantly a clear water pumping solution has a robust grill on the inlet to the pump which allows for its use in conditions where normally submersible pumps would struggle. The overall design and build quality of Audex makes it stand the test of time in these harsh conditions, all the while providing you with a highly reliable and efficient solution.

Water Treatment

Critical for the functioning of society today, water and sewage treatment requires durable technology to enable safe, reliable draining and pumping of water and waste.

A wide range of heavy duty Audex pumps exist to meet every need within the water treatment industry allowing for extremely reliable and cost effective solutions.

Audex pumps however are not suited for heavy duty sludge and so are often used in tandem with other pumps for the handling of raw sewage and sludge pumping.

Wash Plant Feed

Often mining and ore processing can unearth precious metals in trace amounts. By effectively washing the output of the operation higher profits can be obtained by isolating these desirable materials as well as other useful materials. Washing aggregates and ore mining by-products is essential for unlocking the full potential of any mining operation. The reliable and efficient management of water slurries which have a high solid content is therefore necessary for a profitable washing process.

Audex often is the pump of choice in a wash plant feed as the water source is usually reasonably clear water and Audex can provide a large volume reliably.

Sump Pumps

Sumps are often found in wash plants and machinery pits and the collected water often contains a mixture of solids and a relevant pump is required for the level of solid content.

Sump pumps have to deal with the harsh conditions arising from a mixture of machinery run off, ground water and general drainage water. These sumps quickly fill with silt which needs to be removed with the water in order to keep the sump operational. For these reasons a ruggedly designed pump with features to deal with a variety of different solid content for a reliable and long term solution is required. Which type and brand of pump depends on the size of the application however for near clear water condition an Audex is an excellent choice.
AM Series

Audex AM Series Dewatering Pumps

The AM series of pumps offer a huge range of products to meet even the most demanding of applications.

These pump sets are built to very high standards and have been designed with a clear focus on reliability, efficiency and durability and are available in diesel or electric drive configurations. All pumps can be provided as open skid mounted units or built up complete with a high specification acoustic enclosure. They feature very simple and user friendly control stations which show important information in a clear and simple layout.

They can be offered with a choice of engines including Perkins and Caterpillar depending on customer preference. Custom built units are available, please contact your distributor regarding your requirements.

Further Information

- Meet latest emissions regulations
- Excellent fuel efficiencies
- Very heavy duty construction
- Modular construction for ease of maintenance
- Maximum flow rates of up to 6500m³/hr
- Maximum heads of up to 210m
- Diesel and electric pump sets
- Custom built pumps available
- Full bunded unit for environmental protection
- Reliable vacuum priming system
- Very user friendly and robust control panel for ease of operation
- Unique run-dry mechanical seal for maximum service life

Further Information

- Stainless steel outer casing, stator casing, strainer, shaft and hardware for maximum corrosion resistance.
- Hardened cast iron (A.L. - 040/075) and hi chrome semi open abrasive resistant impeller (A.L. - 150).
- Double silicon carbide/silicon carbide and carbon/ceramic mechanical seals.
- External oil seal for added protection against abrasives.
  - Cast iron suction diffuser.
  - Automatic on/off/on thermal.
  - Class F motor insulation.
  - Hi-torque single phase split capacitor motor design.
- 10m of power cable with plug and strain relief.
- Built-in float option available.

Seal Protection Device

Here at Audex we strive to bring fresh ideas and products to the market that help our customers maintain a competitive edge.

The Audex Seal Protection Device does exactly that. Available as an extra on any Audex pump, this device is guaranteed to save you money and time. The Audex Seal Protection Device turns the pump off as soon as it senses any moisture behind the first seal. The red light indicates a seal failure and the pump is automatically turned off.

This removes the risk of the second seal failing and the motor burning out which would clearly result in a costly pump rebuild. Therefore you only have to replace a low cost seal rather than expend thousands on a new pump or refurbishment.

Furthermore, the pump is only likely to be out of action for a matter of hours. Contrast this with the possibilities of a long and costly repair project or long lead time on a new pump.

Further Information
